

Siblik-Roadshow 2010

During a comprehensive info tour with eight stops all over Austria, the Austrian Insta representation Siblik brought light+building news and trends of 21 suppliers to Austrian electricians. Many of them, however, had been in Frankfurt in April, but they took the opportunity of being informed of the vast product range again. The lecture was held by Siblik training manager Michael Wolfram. He presented the Insta novelties instalight® 3065, the compact LED beamer, and instalight® 4020, the variable hand rail system which, like many other products from other manufacturers, could be seen in function in the product exhibition.

Also the information given by Siblik area manager Alfred Pichsenmeister were of great interest who for quite a long time had been dealing with the forward-looking subjects sustainability and electric mobility. These subjects offer good prospects, for there must be a shift in attitude – the sooner the better. »Rising energy prices « and »climatic change« are only two keywords the electrician will have to face competently and in a sustainable way in the near future. For example by using LED as lighting medium or photovoltaic for a self-sufficient energy supply combined with cross-system management systems like KNX. They control and visualize the energy flow in a low-energy building and thus promote optimized solutions. Even the EU increasingly demands energy self-sufficient buildings.

So it was not surprising that the audience agreed with Alfred Pichsenmeister when he summarized: Siblik has the competence and an overall product package when it comes to solutions with renewable energy.
